American Telecommunications Certification Body, Inc.
6731 Whittier Avenue
Suite C110
McLean, VA 22101

FCC ID: XWS-CKPxxW
IC ID : 8721A-CKPxxW

SAR/RF Exposure:

Although SAR/MPE calculations are not required for this device due to the low power output, the following SAR evaluation is included for reference.

As per FCC rules no SAR/MPE evaluation is required provided the power is below the following threshold:

Tunable range of device: 2402 -2481 MHz
Center of tunable band : 2441 MHz

SAR Limitation in mW based on center of band
= 60/fmhz
= 60/2441
= 0.02458 w or 24.58 mW

Therefore 24.58 mW is the threshold for no SAR Evaluations. In this case the maximum output powers are as follows:

Max Antenna Gain = 0.28 dBi
Conducted Power = 0.38 dBm
RF Power output of device (Antenna gain + Maximum Conducted RF Power output)= 0.66 dBm
Total RF Power output in mW = 1.17 mW
S (power density) at 20 cm: 0.000232 mW/cm²

Therefore the maximum output power including antenna gain is 1 mW, well below the SAR evaluation threshold of 24.58 mW.

Sincerely,
Glen Moore
Wireless/EMC Manager
